Work History

2019-10 - Current

Software Developer

TXT Ghana, Accra

- Developed dashboards (Vue.js/Laravel) for company's internal applications management and company's customers.
- Built a new API (Express - Node.js) to subscribe clients to one of the company's main service.
- Worked on the development of a new bulk SMS platform, used by companies to send SMS to thousands of customers, weekly.
- Restructured the development of USSD applications and **created a framework to simplify and speed up the development of USSD applications**. One of the usefulness of the framework showed up when the company wanted to create an application that will centralize all the USSD applications of a particular client in one main application and allow the user to switch among their applications (what we called a USSD Switch). Such goal was a little difficult to achieve with the old approach. **The project was finished in a day with the framework**.
- The same framework is also used to create an *intelligent Question and Answer system* on
